Pred. No. is the number of results predicted by chance score greater than or equal to the score of the results
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Organ: mixed (see below); Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker: Site_1: Not I: Site_2: Eco RT: Equal amounts of plasmid DNA from three normalized libraries (melanocyte 2NbHM, pregnant uterus NbHPU, and fetal heart NbHH19W) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 260232-265223, 340488-345479, and 484488-489479."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Medicago truncatula

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)pblAp129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                            A DNA tag (T72784) having HindIII, SfiI, NotI and a defective HindIII site is used to tag human DNA from malignant, metastatic cancer calls in a novel method of screening and recovering metastasis-inducing DNA (Met-DNA). This method involves transferring the human DNA into a cell line (pref. rat Rama 37) that produces only benign, non-metastasing tumours when injected into a syngeneic animal, injecting the transformed cells into a syngeneic animal, injecting the transformed cells into a syngeneic animal, electing these animals having metastasing tumours, and recovering the Met-DNA (see also T72785-90) from them. The human DNA is tagged to assist in its removal or insertion from con into a host or vector. The tagging procedure overcomes the problem of identifying the inserted human DNA sequences in the rat genome of the transfected cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                               cDNA encoding an immunoglobulin (Ig), light chain, constant region. The primer can be used in a novel method for the production of recombinant antibodies, comprising the selection of B cells from a lymphocyte fraction, isolation of mRNA from individual B cells, reverse transcription of the mRNA into cDNA, amplification of the cDNA by PCR and cloning and expression of the cDNA. The recombinant antibodies can be used for diagnosis and/or therapy, while the method avoids the need for intermediate separation of light and

polypeptides, or nucleic acids encoding them, can be used to modulate cellular physiology by modulating semaphorin K1 activity, e.g. semaphorin K1 polypeptide fragments or antisense nucleic acids can be used to enhance neurite outgrowth from damaged neurons. The polypeptides can also be used as immunogens, reagents for isolating other semaphorins, or as reagents for screening chemical libraries for lead pharmaceutical agents. The nucleic acids can also be used as probes and primers for diagnostic
                                                                                                                                                                                                   encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii occyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting method can be used for perventing method can be used for prasalte cysts or occysts in feces, e.g. from enteric apicomplexa occysts such as Cryptosporidium occysts and Toxoplasma occysts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provided isolated human semaphorin K1 polypeptides. This represents the DNA sequence of the SLDH gene encoding a protein with sorbitol dehydrogenase (SLDH) activity. The DNA also encodes an open reading frame (ORF2) product upstream of the SLDH open reading frame, needed for SLDH activity in vivo. Host cells transformed by a vector comprising the SLDH DNA sequence are used for the recombinant expression of the sorbitol dehydrogenase. Recombinant D-sorbitol dehydrogenase is useful for producing L-sorbose from D-sorbitol. L-sorbose is an important intermediate in vitamin C production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Prototype Stealth virus clone; atypically structured virus; vacuolating cytopathic effect; cytopathic virus detection; malignancy; multiple myeloma; lymphoma; brain tumour; breast cancer; salivary gland tumour; Alzheimer's disease; parkinson's disease; spongiform encephalopathy; multiple sclerosis; schizophrenia; manic depression; major depression; personality disorder; autism; Rett's syndrome; attention deficit; oppositional defiance; aggression; anorexia nervosa; bulimia; multi-system illness; virus infection; ss.

236925-30 represent the nucleotide sequences of prototype Stealth virus clones. The sequences illustrate the type of sequences that can be used to generate probes and to predict antigenic and biologically active products obtainable from a viral isolate, in the methods of the invention. The specification describes tissue culture, serological and molecular based methods to detect atypically structured viruses, such as Stealth viruses, which are able to induce a vacuolating cytopathic effect (CPE) in tissue culture, and are distinguishable from Known cytopathic viruses, by appearance progression and/or host range, or by serological, electron microscopic and/or molecular markers. The products can be used for detecting viruses in patients with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /*tag= e

```
This sequence represents a Stealth virus nucleic acid clone. The invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA from a sample suspected of containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 identified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is used to detect stealth virus in a biological product, food or in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                determine capacity of the virus to recombine with and potentially alter the nucleic acid sequences of a cell or bacterium.
                                                                                                                       g "this nucleotide is represented as a * in the specification, and is included to maintain the base numbering given in the specification"
                                                 /note= "this nucleotide is represented as a * in the specification, and is included to maintain the base numbering given in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               environment. The method is also used to evaluate agents for their inhibitory or stimulatory effects on stealth virus replication and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
Ten new olfactory receptor proteins and their biallelic markers have been described. The sequences encoding these receptor proteins and which contain the biallelic markers can be used for genotyping. The olfactory receptor proteins can be used to screen for substances which bind to them. See GENESEQ records 293816-25 and Y83386-95.
                                                                                                                                                                                                                                                                                                                                New nucleic acids encoding ten different olfactory receptor proteins and their biallelic markers, are useful in genetic analysis and in screening for compounds which bind to the receptor proteins

                                                                                                complementary to the lambda DNA sequence adjacent to the cloning site for the CDNA insertions (see Q70113-14). In addition, primers were designed which were complementary to the plus strand of the most 5' region of the EK coding sequence (see Q70115-16). Subcloning and sequencing provided a 116 amino acid EK heavy chain. This protein contained regions corresp. to tryptic peptides (see R57295-9).

An isolated DNA molecule that consists essentially of the nucleotide sequence that corresponds to the sequence represented by position 3950 to about 2390 and from position 3948 through position 2398 of N81768 is claimed. Also claimed is a peptide sequence that consists of a 5-40 AA residue sequence that corresponds to a sequence of the 540 AA residue protein (P81351) or the 517 AA residue protein (P81868) coded for by the DNA sequence. The proteins can be used for determining previous immunological exposure of a mammal to M.tuberculosis or M.bovis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The gene was isolated by probing a lambda gtll expression library of M.tuberculosis DNA with monoclonal antibodies directed against M.tuberculosis-specific antigens. The 19kD, 71kD and the 65kD proteins and genes are claimed, and so is a vaccine comprising DNA encoding M.tuberculosis protein in a recombinant vaccine vector. P80216 is encoded on the complementary strand.
                                                                                                                                                                                                                                                        Gaps

This DNA sequence encodes the 65 kDa heat shock protein (see W44702), designated Mt Hsp65, of Mycobacterium tuberculosis. This protein cross-reacts with a component of articular cartilage, human Hsp60, that is up-regulated in the joints of arthritic patients. A claimed method for treating or preventing an autoimmune disease in ammmal comprises: (a) providing a particle coated with an antigen against which an immune response is mounted in the autoimmune disease. (b) delivering the particle into the recipient cell of the mammal; and (c) repeating step (b) until either a reduction in a cytotoxi immune response or a desensitizing immune response is induced in the mammal. Alternatively, step (a) comprises providing a nucleic acid construct comprising a coding sequence for the antigen of aconstruct to the recipient cell, and delivering the construct to the recipient cell, and delivering the construct to the recipient cell using a gene gun. The antigen of step (a) is selected from collagon, Mt Hsp65, mand, the recipient cell with the mand.

```

```
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions the invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer.
                                                                                                                                                                                                                                                                                                                                                                     Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated cancer associated nucleic acids and polypeptides -isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers
sclerosis. It represents a novel use for the known Mt Hsp65 gene.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

<b>-</b>	Direct Submission Submitted (O'MAY-2000) Streptomyces coelicolor sequencing project, Submitted (O'MAY-2000) Streptomyces coelicolor sequencing project, Dayid A. Hopwood, [3] John Innes Centre, Norwich Research Park, Colney, Norwich, Norfolk NR4 7UH, UK  Notes: Streptomyces coelicolor sequencing at The Sanger Centre is funded by the BBSRC and Beowulf Genomics Details of S. coelicolor sequencing at the Sanger Centre are available on the World Mude Web.  (UBL: http://www.sanger.ac.uk/Projects/S_coelicolor/) CDS are numbered using the following system egy SCPB7.01c. SC (S. Coelicolor). TB7 (Cosmid name). Oll (first CDS), c (complementary strand).  The more significant matches with motifs in the PROSITE database are also included but some of these may be fortuitous. The more significant similarity to other CDS in the database. The length in codons is given for each CDS.  The more significant similarity to other CDS in the database. The length in codons is given for each CDS.  The position of possible ribosome binding site sequences are given where these have been used to deduce the initiation codon.  Gene prediction is based on positional base preference in codons using a specially developed Hidden Markow Model (Krogh et al., Gene 30:157-66(1984) as implemented at http://www.nih.go.jp./  jun/cgl-bin/frameplot.pl. CAUTION: We may not have predicted the correct initiation codon. Where possible we choose an initiation codon of the sequence (optimally 5-13bp before the mitiation codon). If this cannot be identified we choose the most unstream initiation codon. This sequence (optimally 5-13bp before the initiation codon. If may be shorter because we only sequence overlapping sections once, or longer, because we only sequence overlapping sections once, or longer because we only sequence of mail overlap between neighbouring submissions.	restriction fragment. Human DNA sequence from clone RP3-402G11 on chromosome
22q13.31-13.33 Contains the MAPK12 gene for mitogen activated
protein kinase 12 (SAPK3), the MAPK11 gene for mitogen activated
protein kinase 11 (FRKM11), gene KIAA0315, the gene for a novel
protein similar to KIAA0901 and mouse histone deacetylase MHDA2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /product="putative methylthioadenosine phosphorylase"

http://www.sanger.ac.uk/fdp/Christon can be found at During sequence assembly data is compared from overlapping clones. Muring sequence assembly data is compared from overlapping clone to together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with nortation and to the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Bm:. BMBI: Sw:. SWISSPROT: Tr:. TREMBL: WP: WORNPEP: Information on the WORNPEP database can be found at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    true
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Submitted (08-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire, CEB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk replaced in 29, 1999 this sequence version replaced gi:5262835.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
for a novel protein similar to C. elegans F38A5.2, the gene for a novel protein similar to MRS1 and the gene for a novel protein similar to mouse MOV10 (GB110) and yeast and plant predicted proteins. Contains ESTs, GSSs and fifteen putative CpG islands,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://www.sanger.ac.uk/Projects/C_elegans/wormpep RP3-402G11 is from the library RPCI-3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.
